

My Experience Creating a Portfolio Website

Hello everyone,

In the second semester, I was given an individual project from school to create my own portfolio website. This project was completed independently, not in groups, and we were given approximately two months to finish it, starting from April until early May.

This was my first experience creating a website, and it became one of the most memorable projects I have ever worked on. At first, I felt both excited and confused because everything was new to me.

The first step was designing the website using Figma. At that time, I was not familiar with Figma because I usually used Canva for designing. As a result, I found it difficult to understand the tools and features. I was confused about arranging the layout, choosing suitable colors, and creating a design that looked attractive and professional.

Even though it was challenging, I did not give up. I searched for inspiration on the internet and watched many tutorials to learn how to use Figma. Step by step, I began to understand the application and was finally able to create a neat and visually appealing design.

After finishing the design, I continued to the coding stage. This part was even more challenging because I had to turn my design into a real website. I used HTML to build the structure, CSS to style the website,

JavaScript to add interactive features, and Tailwind CSS to make the design look modern and responsive.

During the coding process, I faced many obstacles. Sometimes the layout did not match my design, and some elements were difficult to position correctly. There were moments when I had to revise my code repeatedly until everything looked just right. Although it was tiring, I learned a lot from every mistake.

As time passed, my website gradually became better. I improved the design, fixed the errors, and added more attractive features. Seeing the final result made me feel proud and satisfied because all my hard work had paid off.

From this project, I learned many valuable lessons. I became more independent, patient, and persistent. I also gained new skills in designing with Figma and building websites using HTML, CSS, JavaScript, and Tailwind CSS.

Although the process was not easy, I am very grateful for this experience. Creating my first portfolio website was both challenging and enjoyable, and it gave me confidence to continue learning and improving my web development skills in the future.
